The invention discloses a human factor VII polypeptide, or a variant or derivative of it, where an amino acid has been modified. This change results in a polypeptide with the same or an increased activity when compared to recombinant wild type human Factor VIIa. Blood coagulation consists of a complex interaction of various blood components that eventually give rise to a fibrin clot. Initiation of the haemostatic process is mediated by the formation of a complex between tissue factor and factor VII (the active form of the Factor VII zymogen). This complex activates Factors V and VII leading to a full thrombin burst. The cutivates Factor VII leading to a full thrombin burst. The thrombin converts fibrinogen to fibrin resulting in formation of a fibrin clot. The Factor VII zymogen, or its derivative, can be modified in its catalytic centre to inhibit the ability of the Factor VII polypeptide to preparing a medicament for the treatment of bleeding episodes, for the chancement of the normal haemostatic system, especially for the chancement of the normal haemostatic system, especially for the treatment of haemosphilia A or B and for inhibiting thrombus formation. The inactivated factor VII derivatives are useful for treatment of haemosphilia A or B and for inhibiting thrombus formation. The inactivated factor VII derivatives are useful for treating intimal hyperplasia, restences: a randocent conners and opposition and context of an anchor metaster and cornary and opposition and context and cornary and opposition and context which anchors are useful for treating intimal and cornary and context and some and context of an anchor metasters.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 2919
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     4956 ITATAATGGTTACAAATAAGCAATAGCATCACAAATTTTCACAAATAAAGCATTTTTTTC 4897

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              219 GTÄGGAGTAGTAGTAGTAGCÄGGAGTÄGTÄGGAGTÄGTÄGTÄGTAGTAGTÄGTÄGTÄ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryores for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABLi6176-ABL30511), expressed DNA sequences (ABLi6176-ABL30511), expressed DNA ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pot_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New DNA construct comprising a modified nucleic acid molecule having at
                                                                                                                      ed nucleic acid detection reagent for detecting 1000 or more Drosophila and for elucidating cell signaling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              fungicide; virucide; ds.

The present invention describes a DNA construct (I) comprising a modified nucleic acid molecule having a nucleotide sequence which is at least 80%, but less than 100%, homologous to two or more desired trait DNA molecules and which imparts the desired trait to plants transformed with the DNA construct. Each of the desired trait DNA molecules relative to the construct. Each of the desired trait DNA molecules relative to the construct. Each of the desired trait DNA molecules relative to the construct. Each of the desired by no more than 3 percentage points. Also described: (1) a DNA expression vector comprising the DNA construct above; (2) a construct above; (3) a transgenic construct above; (4) imparting a trait to plant transformed with the DNA construct above; (4) imparting a transgenic plant seed and propagating a plant from the planted construct above; (5) preparing a molecule cold molecule cold molecule cold molecule cold molecule cold molecule suitable to impart multiple traits to a plant; and (6) determining confined multiple desired traits can be imparted to plants by a single confined and insecticide activities, and can be used in gene therapy. The modified nucleic acid molecule. (1) can have antibacterial, fungicide, variety of pathogens including viruses, bacteria, fungi, virolds, construct may also be used colding to impart a desired genetic trait to the plant, such as desired colour, construct may also and insects. The DNA construct may also be used to impart a desired genetic trait to the plant, such as desired colour, construct invention of enzyme production), and plant the colour, construct invention and invention invention invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       2755 AAGAGTIGGACACGACTGAACTGAACTGAACTGAACTGTACTGAAACCTTAGTAGTT 2814

                                                                                                                                                                                                                                                                                                                                                                                                                                                       AAH57161 to AAH57576 represent cell and tissue specific polynuclectide sequences (I). (I) can have cytostatic, immunomodulatory and neuroprotective activities, and can be used in gene therapy. (I) and proteins (II) encoded by then are used in high throughput screening assays to select DNA molecules, RNA molecules, peptide nucleic acids, mimentos, peptides, proteins, agonists, antagonists, antibodies or their ragments, immunoglobulins, inhibitors, drug compounds and pharmaceutical agents. Expression of (I) in a sample indicates the differentiation of embryonic stem cells into a tissue selected from brain, heart, kidney, liver, lung, skeletal muscle or pancreatic tissues. (I) and (II) are used to produce an expression profile that defines a metabolic or developmental process, treatment, condition, disease or disorder. The gene profile can be used for diagnosis, prognosis or monitoring of treatments and for investigating a predisposition to a disorder where the gene is associated with a cancer, immunopathology or neuropathology
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      cancer; cell proliferative disorder; autoimmune disorder; inflammatory disorder; infection; hormonal disorder; metabolic disorder; neurological disorder; gastrointestinal disorder; transport disorder; connective tissue disorder; drug screening; proteome analysis; gene therapy; antisense therapy; genotyping; transgent animal; knock in; disease model; toxicological testing; transcript imaging; protein modification; protein maintenance; gene; ss.
                                                                                                                                                                                                                                                          New cell and tissue specific polynucleotides useful for diagnosis, prognosis or monitoring of treatments for disorders where the gene is associated with a cancer, immunopathology or neuropathology.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

The invention relates to novel human diagnostic and therapeutic polymucleotides designated dithp (ACC46080-ACC46749) and to their encoded polymucleotides designated dithp (ACC46080-ACC46749) and to their encoded proteins (ITITHP, ABR4136-1812). The invention also relates to proteins (ITITHP, ABR4136-1812). The invention also relates to polymucleotide sequences at least 90% identical to the dithp cDNA sequences of the invention; recombinant vectors, host cells and transfering a dithp nucleic acid sequence; the recombinant production of DITHP proteins; antibodies specific for DITHP proteins and protein sequences; methods of detecting dithp nucleic acid sequences; methods of sessessing the toxicity of test compounds using a dithp hybridisation of text compounds using a dithp hybridisation proliferative disorders; and protein sequences and DITHP proteins may be used in the proliferative disorders; autoimmume or inflammatory disorders; bacterial, proliferative disorders; autoimmume or inflammatory disorders; bacterial, viral, fungal or parasitic infections; hormonal disorders; bacterial, viral, fungal or parasitic infections; hormonal disorders; transport disorders; and connective tissue disorders; methodies or secen for modulators of protein activity or gene expression. DITHP proteins can additionally be used in analysis of the proteome of a tissue or cell type and to induce antibodies. The dith mucleic acids are additionally useful in somatic or germline gene therapy of the disorders additionally useful in somatic or germline gene therapy of the disorders continuents above, as a source of antisense sequences, as a source of additionally useful in somatic or germline gene therapy of the disorders in the generation of transgenic animal models of human disease or knock in humanised animals, in toxicological testing, and in transcript imaging. The present sequence represents a dithp cDNA encoding a DITHP protein which is involved in protein modification, and disease or knock in which is protein which mas obtained in e
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   494
                                                                                                                                                                                                                                                                                                                                                                Novel human diagnostic and therapeutic polypeptide useful for identifying test compound which specifically binds to a polypeptide encoded by human diagnostic and therapeutic polynucleotide, and to induce antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           435 idircidadaccecadadrocecedadaidecaereaggaecredadareedeareedada

The present invention describes a method (M1) for screening for an antineoplastic agent. The method involves exposing cells to a chemical agent neoplastic activity, determining a change in expression of at least one gene (I) of a signature gene set, where (I) comprises a sequence (S) selected from 447 sequences (given in Abl61664 to Abl70110), or is at least 95% identical to (S), where a change in expression is indicative of anti-neoplastic activity. (I) has cytostatic activity and can be used in gene therapy. MI can be used for screening an anti-neoplastic agent, and can be used for producing a product which is the data collected with respect to the anti-neoplastic agent as a result of MI, and the data is sufficient to convey the chemical structure and/or properties of the agent. MI can be used in the treatment of cancer such as colon, breast, stomach, lung, thyroid, oesophageal, ovarian, kidarey, prostate or pencreatic cancer, adenocarinoma, carcinoma, carcinoma, cancer, infiltrating ductal cancer, infiltrating lobular cancer, squamous cell carcinoma, neuroendocrine carcinoma, papillary carcinoma and Wilm's
                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New serine protease(s) and kinase involved in regulating cell activity and viability - particularly the testis-specific protease HELA2 used for modulation of fertility and as tumour suppressor.

AAV59134-36 represent HELA2 homologues. The genes are found in a cluster on chromosome 16p13.3 HELA2 was isolated from HeLa cells, and has homology to serine proteases. The protein is involved in or associated with regulation of cell activity and/or viability. Administration of cell activity and/or viability. Administration of cell activity and/or viability. Administration of Extension of HeLA2 calcos fertility. HellA2 is also a suppressor of testicular germ cell cancers (seminoma) and is also expressor of testicular cancers (of colon, pancreas, prostate and ovary), so is a marker/potential therapeuic target for cancer. The promoter from the CHELA2 gene is useful for testis-specific expression of other genes, e.g. for gene therapy or modulation of fertility. Drugs that block activity of HELA2 should have antitumour activity (other than in testis) while in testis recombinant HELA2 can be used for orchidectomy). Identification of mutant forms of HELA2 can be used to diagnose infertility
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                813 IGTTTGTTTCCAAGGCAAACCATTCAATATCACAGTAATCCAAGTCTATGCCCCAACCAG 872

The present invention describes NOVX proteins, where X can be 1 to 55

(e.g. NOV1). Also described: (1) a composition comprising a polypeptide described above and a carrier; (2) a kit comprising, in one or more containers, the composition described above; (3) an isolated mucleic acid described above; (3) an isolated mucleic acid comprising the above processed above; (5) a cell comprising the above vector; (6) an antibody that immunospecifically comprising the above vector; (6) an antibody that immunospecifically by the prosence or amount of the above polypeptide or nucleic acid molecule in a first mammalian subject; (9) a cell compression of the above polypeptide or nucleic acid molecule in a first mammalian subject; (9) a method for identifying a potential therapeutic agent for a polypeptide or nucleic acid molecule in a first mammalian subject; (9) a method for identifying a potential therapeutic agent for use in treating a pathology that is related to an aberrant expression or aborrant physiological interactions of the polypeptide for identifying a pathology that is related to an aberrant expression or aberrant physiological interactions of the polypeptide is useful in a method for polypeptide described above polypeptide in a method for polypeptide described above polypeptide. Novx a pathology associated with the polypeptide; (12) a method of the polypeptide described above polypeptide in a mannal; and (14) a method for producing the above polypeptide in a method for producing the above polypeptide in a mannal; and (14) a method for producing the above polypeptide in a sequences have antidiabetic, anoretic; antibacterial, virucide, polypeptide is useful in manniacturing a medicament for treating a sequence associated with a human disorders and was disorders such as Alzielemer's disease or pervent metabolic acid molecule may be used to diagnose, infections, eachexia, cancer, informance disorders, when a human disorders and various disorders whener invention.

                                                                                                                                             ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The sequence represents a DNA encoding an angiotensin converting enzyme splice variant (ACEV) polypeptide. The polypeptides of the invention include variants of granulocyte colony stimulating factor receptor, glucagon, interleukin 6, platelet-derived endothelial cell growth factor, cyclin-dependent kinase inhibitor 1C, cellular tumcur antigen P53, and associated nucleic acids are useful for identification of variant sequences and detection of candidate compounds capable of binding the molecules. The sequences of the invention can be used in the treatment and disposis of various disorders including cardiovascular diseases such thrombosis, renal diseases such as diabetic nephropathy, muscular

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Inhibition of tissue factor, vascular restenosis and platelet deposition - using modifier factor VII unable to activate factors IX and X, e.g. for treating thrombosis, embolism, stroke etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AAQ80296 shows the cDNA encoding human Factor VII. Factor VII is a trace plasma glycoprotein that circulates in blood as a single-chain zymogen. The zymogen is catalytically inactive, and is converted into a two-chain active mol. by cleavage of an internal peptide bond located approx. In the middle of the mol. Factor VIIa rapidly activates Factor X or Factor IX by limited proteolysis. Modified Factor VII has anticoagulant properties, for preventing the coagulation cascade. The modified factor VII has an active site modified by at least one amino acid substitution, and in its modified form is capable of binding tissue factor and
                                                                                                                                                                                                                                                                                                                                                                                                                        Factor VII, plasma glycoprotein, derivative, tissue factor, TF; inhibition, vascular restenosis, platelet deposition, catalytic centre, factor IX; factor X; inactivation, thrombosis, embolism; stroke, ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1450 GAGACCATCCCCATGGAAAAGAAATGCAAAAAAGCAAAATGGCTCTCTGGGGAGGCC 1506

Inhibiting thrombus formation by topical administration of modified factor VII - also used to maintain vascular patency, prevent myocardial injury and improve regional myocardial blood flow. WPI; 1998-052245/05. P-PSDB; AAW31687.

Example 1; Page 69-73; 97pp; English

The sequence is that encoding a Ser144Ala modified factor VII which can be used as part of a method for inhibiting thrombus formation. The method is used to maintain or improve vascular patency, to prevent or minimise myocardial injury associated with post-ischaemic reperfusion and to improve regional myocardial blood flow during post-ischaemic reperfusion. The method is particularly used where the site of thrombus or reduced patency is associated with (micro) surgery, angioplasty or trauma or where the myocardial injury is myocardial necrosis. Particular applications are in treatment or prevention of intimal hyperplasia or restenosis caused by stroke; disseminated intravacular coagulation; fibrin deposition associated with endotoxaemia and myocardial infarction 

Sequence 2422 BP: 596 A; 712 C; 692 G; 422 T; 0 U; 0 Other;

ö The present invention describes a method for the inhibition or minimisation of myocardial injury associated with post-ischaemic reperfusion by administering factor VII, which has at least 1 modification in its catalytic triad (therefore inhibiting the ability of factor VII to activate plasma factor X or IX). The method can be used for inhibiting or minimising myocardial injury and for imparting regional myocardial blood flow associated with post-ischaemic reperfusion. It can also be used for inhibiting blood coagulation, platelet deposition, thrombus formation and maintaining or improving vascular potency. Factor VII can be administered at relatively low doses and does not produce undesirable side effects. Further it acts specifically at sites of injury. The present sequence encodes Factor VII Factor VII; catalytic active site; blood coagulation; plasma; Factor X; Factor IX; vasotropic; antiischaemic; anticoagulant; myocardial injury; post-ischaemic reperfusion; platelet deposition; thrombus formation; Gaps Inhibition or minimization of myocardial injury associated with post-ischemic reperfusion. ö Length 2422; DB 1; Le 2.2e+02; Rasmussen ME; 0.6%; Score 21; DB 100.0%; Pred. 2003-722330/68. WPI; 2003-722330/ P-PSDB; ADC24227. New NOVX polypeptides and nucleic acids, useful for diagnosing or treating e.g. cardiomyopathy, atherosclerosis, hypertension, scleroderma, obesity, prostate cancer, AIDS, bronchial asthma, Crohn's disease, or multiple sclerosis.

Claim 20; SEQ ID NO 33; 229pp; English.

The present invention describes novel human proteins, designated NOVX proteins. The NOVX sequences have cardiant, antiarteriosclerotic, hypotensive, vasotropic, dermatological, anorectic, immunosuppressive,

```
cytostatic, antiinfertility, haemostatic, anti-HIV, antiasthmatic, antiinflammatory, neuroprotective, anabolic, nootropic and antiinflammatory, neuroprotective, and can be used in gene therapy. The NOVX caquences can be used as a therapettic in the manufacture of a medicament for treating a syndrome associated with a human disease, such as a pathology associated with NOVX. The NOVX proteins and nucleic acids or conditions associated with NOVX. The NOVX proteins and nucleic acids or conditions associated with NOVX sequences, including cardiomyopathy, atherosclerosis, hypertension, congenital heart defects, pulmonary stenosis, scleroderma, obesity, metabolic disturbances associated with obesity, transplantation, adrenleukodystrophy, congenital adrenal hyperplasia, prostate cancer, diabetes, metabolic disorders, neoplasm, adenomarcinoma, fertility, haemophilia, graft versus host disease, also conceria, neurodegenerative disorders (e.g. Alzheimer's disease, disease, and wasting disorders (e.g. Alzheimer's disease, or parkinson's disease), immune disorders associated with chronic diseases. The proteins can also be used as immunogens to produce antibodies and as the content of the proteins can also be used as immunogens to produce antibodies and as the content of the proteins can also be used as immunogens to produce antibodies and as the content of the proteins can also be used as immunogens to produce antibodies and as the content of the proteins can also be used as immunogens to produce antibodies and as the content of the proteins can also be used as immunogens to produce antibodies and as the content of the proteins can also be used as immunosed manaled the content of the proteins can also be used as immunosed can be content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     identifying individual from minute biological samples (tissue typing), and in forensic identification of a biological sample. The present sequence encodes human NOV8a from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 2422 BP; 596 A; 712 C; 692 G; 422 T; 0 U; 0 Other;

Gray CL; Woodbury RG, Insley MY, Ϋ́, Berkner Hagen FS, Murry MJ,

WPI; 1986-326899/50. P-PSDB; AAP60056. DNA construct used to transfect hosts - to produce protein which activates to give factor VIIa.

The invention relates to a purified nucleic acid molecule associated with lactation or muscle and fat deposition (designated LMFD), derived from cattle, and the LMFD nucleic acid can specifically hybridise to a second nucleic acid molecule comprising any of 15112 nucleotide sequences, appearing as ABX34895-ABX49947, or complements of them. Also included are ; (1) a transformed cell having a nucleic acid comprising an LMFD nucleic acid linked to a promoter and a 3' non- translated sequence that

Claim 2; SEQ ID NO 14612; 245pp; English.

ö The partial factor VII cDNA sequence is from cDNA clon1 lambda VII2463. It is used in a DNA construct which contains a nucleotide sequence encoding a protein which, on activation, has the same biological activity for blood coagulation as Factor IIa. The nucleotide codes at least partially for Factor VII and comprises sequence encoding a calcium catalytic domain joined to a sceond sequence downstream of this encoding a catalytic domain for the serine protease activity of Factor VIIa. The calcium binding domain comprises a gene encoding Factor VII. IX, X, protein. C, prothrombin on Protein S. The construct is used to transfect host cells to produce the protein which, on activation, yields Factor VIIA. (Updated on 31-OCT-2002 to add missing OS field.) (Updated on 25-New nucleic acid associated with lactation, and muscle and fat deposition, useful for genome mapping, gene identification and analysis, cattle breeding, or for genetically improving cattle. Bovine, ss; EST; expressed sequence tag; lactation; LMFD; muscle deposition; fat deposition; genome mapping; gene identification; gene analysis; cattle breeding. The invention relates to an isolated polynucleotide (I) comprising: (a) any of a group of over 4000 nucleotide sequences (ABV94628-ABV99165); (b) complements of (a); (c) sequences consisting of at least 20 contiguous residues of (a); (d) sequences consisting of at least 75% or 90% identicy stringent conditions; (e) sequences having at least 75% or 90% identity to (a); or (f) degenerate variants of (a); Polypeptides (ABP68596-C) ABP68637) encoded by (I) and oligonucleotide can be used to detect cancer in a patient and compositions comprising polypeptides, polynucleotides, antibodies, fusion proteins, T cell populations and antigen presenting cells expressing the polypeptide are useful in treating pancreatic cancer and stimulating an immune response. The polynucleotides can be used as corbes or primers for nucleic acid hybridisation, in the design and preparation of ribozyme molecules for inhibiting expression of the tumour polypeptides and proteins in the tumour cells, in vaccines and for gene polypeptides and was obtained in electronic form part of the printed specification, but was obtained in electronic format directly from MIPO at fip. wipo.int/pub/published_pot_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; open reading frame; ORFX; gene therapy; cancer; cirrhosis; hyperproliferative disorder; psociasis; behign tumour; haemorrhage; degenerative disorder; osteoarthritis; neurodegenerative disorder; cardiovascular disease; diabetes mellitus; systemic lupus erythematosus; hypertension; hypothyroidism; cholesterol ester storage disease; immune deficiency; immune disorder; infectious disease; autoimmune disorder; rheumatoid arthritis; autoimmune thyroiditis;
                                                                                                                                      New isolated polynuclectide and pancreatic tumor polypeptides, useful idiagnosing, preventing and/or treating cancer, particularly pancreatic

The specification describes subscintainy putting in the specification). ABN15762 to ABN2752 encode the human ORFX or treating or preventing a pathology associated with an ORFX-associated disorder in humans, and in the manufacture of a medicament for treating a synchome associated with ORFX-associated disorder. ORFX polynuclectide synchome associated with ORFX-associated disorder. ORFX polynuclectide synchome associated with ORFX-associated disorder. ORFX polynuclectide synchome associated with ORFX-associated disorder. ORFX polynuclectide synchome associated with ORFX-associated disorder. ORFX polynuclectide correlations being trumours, kelodd, degenerative disorders, and in the treatment of cancer, hyperproliferative disorders, cirrhosis of liver, osteoarthritis, neurodegenerative disorders, disorders related to organ transplantation, cardiovascular diseases, diabetes mellitus, systemic correspondant disorders influenced systemic storage disease, various immune deficiencies and disorders, infectious diseases, autoimmune influences such as multiple sclerosis, rheumatoid arthritis, autoimmune influenced organic gravis, graft-versus-host disease and autoimmune influenced organic gravis, graft-versus-host disease and autoimmune influenced organic gravis, graft-versus-host confice and autoimmune influenced organic gravis, graft-versus-host useful for treating burns, incisions, ulcers, for treating organic protection or regeneration and treatment of ling or liver fibrosis, reperfusion injury in various tissues and conditions resulting from part of the printed specification, but was obtained in electronic form part of the printed specification, but was obtained in electronic format directly from MIPO at fibro, int/published_pct_sequences
                                                                                                                                                                                                                                                                                  present invention describes substantially purified human proteins
                                                                                                                                       Novel human polypeptides and polynucleotides useful for diagnosing
                                                                                                                                                              preventing and treating cardiovascular disease, neurodegenerative, hyperproliferative disorders and autoimmune disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Corn tassel-derived polynucleotide (cdps) SEQ ID NO:4082.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 252 BP; 69 A; 70 C; 62 G; 51 T; 0 U; 0 Other;

The present sequence describes a purified corn tassel-derived polynuclectide sequence (cdps) comprising a nucleic acid sequence selected from those given in ABL70627 to ABL7683. The cdps sequences canced corn tassel-derived polypeptides (CDPs). The cdps sequences can be used for determining altered gene expression, to recover regulatory elements and to follow inheritance of desirable characteristics through hybrid becading programs. (I) are also useful in the evaluation, and alteration of desired characteristics associated with growth and development, disease resistance, environmental adaptability, quality and yield, and as molecular markers for studying inheritance of multigene traits in a plant breeding program. (I) can be used to produce a tassel-specific profile of gene transcription, a transcript image, to clone regulatory elements for use in transformation vectors, to express a polypeptide, to identify, isolate or extend identical or related corn tassel nucleic acid sequences from DNA libraries, in nucleic acid sequences from DNA libraries, in nucleic acid sequences from the presence of and/or to be not hybridisation, and to identify the presence of and/or to be not because the presence of and/or to be not because the presence of and/or to be not because the presence of and/or to be not because the presence of and/or to be not because the presence of and/or to be not because the presence of and/or to be not because the presence of and/or to be not because the presence of and/or to be not because the presence of and/or to be not because the presence of and/or to be not because the presence of and/or to be not because the presence of and/or to be not because the presence of and/or to be not because the presence of and/or to be not because the presence of and/or to be not because the presence of and/or to be not because the presence of and/or to be not because the presence of and/or to be not because the presence of and/or to be not because the presence of and/or to be not because the presence of and/or to t

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to an isolated polynucleotide comprising a nucleotide sequence which hybridises to a sequence selected from one of 316 fully defined sequences given in the specification, antisense molecules complimentary to the sequences, the polypeptides encoded by the sequences and antibodies raised against the proteins. The nucleic acids are useful for detecting differentially expressed genes which correlate with a cancerous state of a mammalian cell i.e. diagnosing cancer (especially lung cancer, colon cancer, breast cancer, prostate cancer and adenocarionma). Modifying the gene products of of the nucleic acids results in inhibition of tumour growth. The nucleic acids are also useful in gene mapping and tissue profiling. The present sequence is one of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         259 AGCTCTGCAAGAGAAATATCATAGTCATGTGATGGGGTGTTTGTATTTTTTCATGGACAATT 200

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            human secreted proteins expressed sequence tags (ESTS) for human secreted proteins expressed in prostate, and encode the proteins given in AAY11716 to AAY1993 respectively. The proteins given represent the signal peptide and aN 1-terminal fragment of a secreted protein. The nucleic acid sequences can be used for producing secreted human gene nucleic acid sequences can be used to develop products for diagnosis and therapy. The proteins obtained may have cytokine activity, cell proteins obtained may have cytokine activity, cell critisis growth regulating activity, haemstopoiesis regulating activity, themostatic/chemokinetic activity, haemstatic and thrombolytic activity, receptor/ligand activity, and recent inhibition activity or other activity, haemstatic and crivity can be used in forensic, gene therapy and chromosome mapping procedures. The sequences can also be used for obtaining corresponding promoter sequences. The nucleic acids encoding the signal peptides can be used for directing extracellular secretion of a polypeptide into a membrane, or importing a polypeptide into a cell

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a purified nucleic acid molecule associated with lactation or muscle and fat deposition (designated LMFD), derived from cattle, and the LMFD nucleic acid can specifically Mybridise to a second nucleic acid molecule comprising any of 15:112 nuclectide sequences, appearing as ABX34836-ABX49947, or complements of them. Also included are (i) a transformed call having a nucleic acid comprising an LMFD nucleic acid linked to a promoter and a 3' non- translated sequence that functions in the cell to cause termination of transcription and addition of polyadenylated ribonucleotides to a 3' end of the mRNA molecule; and (2) determining a level or pattern of a molecule in a bovine cell or tissue comprising; (a) includating a marker nucleic acid (comprising any of the milecule; acid sequences or its complementary nucleic acid molecule obtained from the bovine cell or tissue, where hybridisation between the marker nucleic acid and the complementary nucleic acid molecule obtained from the bovine cell or tissue, to a pattern of the molecule obtained from the bovine cell or complementary nucleic acid permits the detection of the complementary nucleic acid permits the detection of the molecule. The LMFD nucleic acid is used for the detection of the molecule. The LMFD nucleic acid is used for complementary nucleic acid permits the molecule in a bovine cell or tissue. The suseful for genome mapping, gene identification and analysis, cattle of suseful for genome mapping, gene identification and analysis, cattle of spreash tayens to sequence as not shown in the sequence is one of the complement sequence was not shown in the specification but was obtained in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               1048 CAAAGACTAATAGAGTTTTGCCAAGAAATGCACTGGTCATAGCAAACACCCTTTTCCAA 1107
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         92 cacadaargcagcaarrircaccardcaaaaggaccrgccaagggaarrgaccrcriricag 33

The invention relates to an isolated polynucleotide comprising a nucleotide sequence which hybridises to a sequence selected from one of sile fully defined sequences given in the specification, antisens on molecules complimentary to the sequences, the polypeptides encoded by the sequences and antibodies raised against the proteins. The nucleic acids are useful for detecting differentially expressed genes which correlate with a cancerous state of a mammalian cell i.e. diagnosing concer (especially lung cancer, colon cancer, breast cancer, prostate cancer adenocarcinoma). Modifying the gene products of of the nucleic acids results in inhibition of tumour growth. The nucleic acids are also useful in gene mapping and tissue profiling. The present sequence is one of the 316 cancer related cDNA sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               3189 GCTCTTTAAATTCATTATTCTTTGATAACAGCTTCAGTTCTATGGCTTTAATAAAGTTTT 3248

The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a single exon nucleic acid probe of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                               Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human fetal liver.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             118 AGAAGGGCAATGTCATGGTTGTACTTATTAATAGCTGCATTGTAGTTGTGGGGAATA 59

The invention relates to a single exon nucleic acid probe (SENP) (I) for measuring human gene expression in a sample derived from human adult liver, comprising one of 13109 defined nucleotide sequences given in the specification (or complements) fragments). The probe hybridises at high stringency to a nucleic acid molecule expressed in the human adult liver. (I) may be used for predicting, measured in the human adult liver. (I) may be used for predicting and all liver. The genes identified may be in rowlved in genetic liver diseases such as cirrhosis, hyperlipidaemia, hyperlipidaemia and hypercholesterolaemia which is associated with coronary heart disease. ABS25011-ABS51005 represent human liver single exon nucleic acid probes of the invention. Note: The sequence information for this patent does not appear in the printed specification but was obtained in electronic format directly from WIPO at fip.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    118 AGAAGGCCAATGTCATGGGTTGTACTTATAATAGCTGCATTGTAGTTGTGGTGAGGAATA 59

                                                                                                                                               02-AUG-2001
 The invention relates to novel Factor VII (FVII) or Factor VIIa (FVIIa) polypeptide conjugates, comprising at least one non-polypeptide group covalently attached to a polypeptide, where the amino acid sequence of polypeptide differs from that of the wildtype FVIIa (AAM5171) in that at least one amino acid residue containing an attachment group for the non-polypeptide group has been introduced or removed. The FVIIa conjugates have haemostatic, thrombolyvic, cardiant, hepatotrophic and cerebroprotective activity and are useful for treating FVIIa/TF-related diseases or disorders such as haemophilia, liver disease, myocandial infarction, thrombotic stroke and deep-vain thrombosis. The conjugates have increased bioavailability and or reduced sensitivity to proteolytic degradation. Consequently medical treatment using the conjugates have increased bioavailability and or reduced sensitivity to proteolytic degradation. Consequently medical treatment using the conjugates has number of advantages over currently available such as longer duration
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              1443 AGGGATCGAGACCATCCCCATGGAAAAGAAATGCAAAAAGCAAAATGGCTGTCTGGGGA 1502

The present invention relates to the isolation of novel human enzyme polypeptides (AAU22915-AAU23814), and the CDNA and genomic sequences encoding them. The enzyme polypeptides of the invention may comprise the functional classes of oxidoreductases, transferases, hydrolases, lyases, isomerases or ligases. The sequences of the invention are useful in the disorders including hyperproliferative disorders (e.g. cancer), immunodeficiency disorders (e.g. AIDS) autoimmune disorders (e.g. cancer), immunodeficiency disorders (e.g. AIDS) autoimmune disorders (e.g. asthma), cardiovascular disorders (e.g. AIDS) autoimmune disorders (e.g. asthma), cardiovascular disorders (e.g. altherosclerosis), blood-related disorders (e.g. paemophilas), reproductive disorders (e.g. altherosclerosis), blood-related disorders infectious disorders (e.g. influenca). The polynucleotides of the infectious disorders (e.g. Influenca). The polynucleotides of the invention can also be used in gene therapy. AAS40785-AAS41684 represent cDNA sequences encoding for the novel human enzyme polypeptides of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp. Wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; immunosuppressive; antiarthritic; ss; antirheumatic; cytostatic; ardiant; vasotropic; cerebroprotective; neuroprotective; antibacterial; virucide; fungicide; opthalmalogical; vulnerary; secreted protein; rheumatoid arthritis; hyperproliferative disorder; cardiovascular disorder; cardiac arrest; cerebrovascular disorder; Alzheimer's disease; infection; coular disorder; wound healing; epithelial cell proliferation; skin ageing; food additive;
                                                                                                                                                                                                                                                                                        Novel polypeptides and polynucleotides useful for diagnosing, preventing, treating neural, immune system, muscular, reproductive, pulmonary, cardiovascular, renal, proliferative disorders and cancerous diseases.

The invention relates to isolated nucleic acid molecules and their encoded secreted proteins. The nucleic acids and proteins are used to prevent, treat or ameliorate a medical condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. They are also used in diagnosing a pathological condition or susceptibility to a labella condition. Antibodies to the proteins can also be used in alleviating symptoms associated with the disorders and in diagnostic immunoassays e.g. radioimmunoassays or enzyme linked immunosorbant assays (ELISA). Disorders which are diagnosed or treated include autoimmune diseases e.g. rheumatoid arthritis, hyperproliferative disorders e.g. neoplasms of the breast or liver, cardiovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cardiac arrest, orber disorders e.g. Alzheimer's disease, infections caused by bacteria, viruses and fungi and ocular disorders e.g. corneal infection, and many other disorders e.g. Alzheimer's disease, infections caused by bacteria, viruses and fungi and ocular disorders e.g. corneal infection, and any other disorders e.g. Alzheimer, to maintain organs before to prevent skin aging due to subburn, to maintain organs before crashes considered tissues and in chemotaxis. The polypeptides can also be used as a food additive or preservative to increase or decrease storage as a food additive or preservative to increase or decrease storage and inherals, cofactors and other nutritional components. The present capabilities, capabilities, deformed by an order and other nutritional components. The present Novel polypeptides and polynucleotides useful as diagnostic reagents to diagnose diseases or disorders associated with aberrant expression or activity of polypeptides, for treating blood clotting disorder, hemophilia. ```
The invention relates to isolated ovarian related polypeptide (ovarian antigen) comprising a sequence at least 90% identical to a sequence selected from a polypeptide fragment, domain, epitope or full length protein of a sequence (51) appearing as ABG60139-ABG60296 having contein of a sequence (51) appearing as ABG60139-ABG60296 having contein of a sequence (51) appearing as ABG60139-ABG60296 having contein of a sequence (51) appearing as ABG60139-ABG60296 having contein of an enti-S1 antibody and the CDNA clones encoding the proteins of S1. S1, conteining or ameliorating a medical condition in mammalian subject conteining and the CDNA clones encoding the proteins of S1. S1, conteining or ameliorating and edited condition in mammalian subject consolated disorders (61) ansitions of the ovary and/or breast such as infectious diseases (e.g., mastitis), inflammatory diseases (e.g., abscesses), reproductive system disorders (haseases), reproductive system disorders (astendated disorders (sickle cell anaemia), hood-related disorders (sickle cell anaemia), hyperproliferative disorders, urinary system disorders are conteined isorders (halson's disease and parkinson's disease), conforders, musculoskeletal system disorders, neural activity and neurological disorders (Alzheimer's disease and Parkinson's disease), conformental and inherited disorders (biliary liver cirrhosis), conformental and inherited disorders (biliary liver cirrhosis), conformental and inherited disorders (biliary liver cirrhosis), conformental and inherited disorders (biliary liver cirrhosis), conformental and inherited disorders (biliary liver cirrhosis), conformental and inherited disorders (biliary liver cirrhosis), conformental and inherited disorders (biliary liver cirrhosis), conformental and inherited disorders (biliary liver also useful to prevent skin aging, for preventing hair loss, to maintain organs conformed additive or preservative. The present sequence is a condulate anammalian metabolism, to change a mammal's metabolism, to change a me
                                                                                                                                                                                                                                                                                                                                                                                  Novel isolated human ovarian related polypeptide useful for diagnosis/treatment of disorders of ovary and breast such as neoplastic disorders, infectious diseases, inflammatory diseases, and reproductive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 1352 BP; 238 A; 446 C; 407 G; 261 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Claim 1; SEQ ID NO 56; 524pp; English.

(HUMA-) HUMAN GENOME SCI INC.

```
The present invention relates to the isolation of novel human enzyme polypeptides (AAU22915-AAU23814), and the cDNA and genomic sequences colophoptides (AAU22915-AAU23814), and the cDNA and genomic sequences cancing them. The enzyme polypeptides of the invention may comprise the functional classes of oxidoreductases, transferases, hydrolases, lyases, isomerases or lygases. The sequences of the invention are useful in the disorders including hyperproliferative disorders (e.g. ander), immunodeficiency disorders (e.g. AIDS) autoimmune disorders (e.g. ancer), immunodeficiency disorders (e.g. AIDS) autoimmune disorders (e.g. archina), cardiovascular disorders (e.g. AIDS) autoimmune disorders (e.g. archina), cardiovascular disorders (e.g. althorous), inflammatory disorders (e.g. aschma), cardiovascular disorders (e.g. althorous). The polymucleotides of the invention can also be used in gene therapy. AAS40785-AA41684 represent invention and also be used in gene therapy. AAS40785-AA41684 represent clowed invention. Note: The sequence data for this patent did not form part of invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp. WiPo int/Published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; immunosuppressive; antiarthritic; ss; antirheumatic; cytostatic; cardiant; vasotropic; cerebroprotective; nootropic; neuroprotective; antibacterial; virucide; fungicide; opthalmalogical; vulnerary; secreted protein; rheumatoid arthritis; hyperproliferative disorder; cardiovascular disorder; cardiac arrest; cerebrousscular disorder; angiogenesis; nervous system disorder; Alzheimer; disease; infection; ocular disorder; corneal infection; wound healing; epithalial cell proliferation; skin ageing; food additive; preservative; antiproliferative.
                                                                                                                                                                                                              Novel polypeptides and polynucleotides useful for diagnosing, preventing, treating neural, immune system, muscular, reproductive, pulmonary, cardiovascular, renal, proliferative disorders and cancerous diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         .

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   g
                   The invention relates to isolated nucleic acid molecules and their encoded secreted proteins. The nucleic acids and proteins are used to encoded secreted proteins. The nucleic acids and proteins are used to prevent, treat or ameliorate a medical condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. They are also used in diagnoshing a pathological condition or susceptibility to a pathological condition. Antibodies to the proteins can also be used in calleviating symptoms associated with the disorders and in diagnostic immunoassays e.g. radicimmunoassays or enzyme linked immunosorbant assays (ELISA). Disorders which are diagnosed or treated include autoimmune of seases e.g. rheumatoid arthritis, hyperproliferative disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cardiovascular disorders e.g. cardiovascular disorders e.g. cardiovascular disorders e.g. cardiovascular disorders e.g. cardiovascular disorders e.g. cardiovascular disorders e.g. cardiovascular disorders e.g. cardiorers, viruses and fungi and ocular disorders e.g. corneal infection, and many other disorders listed in the specification. The polypeptides can also be used to aid wound healing and epithelial cell proliferation, to preservative to increase or decrease storage crasplantation, for supporting cell culture of primary tissues, to regenerate tissues and in chemotaxis. The polypeptides can also be used as a food additive or preservative to increase or decrease storage capabilities, fat content, lipid, protein, carbohydrate, vitamins, minerals, ocfactors and other nutritional components. The present cencedes a novel secreted protein, etc. The present

                                                                                                                                                                                                                                                    The invention relates to novel Factor VII (FVII) or Factor VIIa (FVIIa) polypeptide conjugates, comprising at least one non-polypeptide group covalently attached to a polypeptide, where the amino acid sequence of polypeptide differs from that of the wildtype FVIIa (AAMS2171) in that least one amino acid residue containing an attachment group for the non-polypeptide group has been introduced or removed. The FVIIa conjugates have haemostatic, thrombolytic, cardiant, hepatotrophic and cerebroprotective activity and are useful for treating FVIIa/Frelated diseases or disorders such as haemophila; liver disease, myocardial infarction, thrombotic stroke and deep-vein thrombosis. The conjugates have increased functional in vivo half life and/or increased plasma half
New conjugate, useful for treating Factor VIIa related diseases or disorders such as hemophilia, liver disease, myocardial infarction and deep-vein thrombosis, comprises non-polypeptide group covalently attached
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   life, increased bicavailability and or reduced sensitivity to protectly degradation. Consequently medical treatment using the conjugates has a number of advantages over currently available such as longer duration between injections. The present sequence is that of a human FVII expression cassette, encompassing the short form of the full length oDNA encoding FVII, for expression of human FVII in mammalian cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Determination of polymorphisms in genes, especially those identifying predisposition to vascular disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; coding sequence polymorphism; vascular pathology gene;
polymorphic site; phenotype correlation; forensic; paternity testing;
medicine; genetic analysis; vascular disease; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human low density lipoprotein receptor exon 2 nucleotide sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ;

The nucleic acids, and primers and probes, are used to identify polymorphisms, which may predispose an individual to disease, especially a vascular disease. They can also be used in phenotype correlations, forensics, paternity testing, medicine or genetic analysis. AAV49550 to AAV49573 represent the proteins which correspond to some of

                                                                                                                    The cDNA sequence encodes human protein C (HPC). It can be obtd. from a lambda-gtll cDNA library prepd. from human liver mRNA by standard methods. The activated protein can comprise one of 3 different truncated light chains, 195 to 644, 647 or 650. The activated HPC, with a truncated light chain is more stable during storage. It can be administered for prophylactic and/or therapeutic treatments of disease states or injuries capabillities. See also W09109951 (AAQ12649). (Updated on 25-MAR-2003 to correct PA field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              1573 CTCCAGAAGAGCCCAAAAGAGGGATGGAAGGACAGAACAGCAGGCCGGTGTGCTTGTTAC 1514

```
The sequence was determined from a clone isolated from a cDNA library proped. From mRNA from Hep G2 cells. It encodes a protein C precursor. Including light and heavy chains, which is cleaved to produce activated controlled in cleaved to produce activated controlled in the for details). The sequence can be manipulated by genetic engineering techniques to express a protein comprising (when cativated) a heavy chain and a truncated light chain comprising (when controlled) a heavy chain and a truncated light chain comprising residues comprises the precursor of formula Pre-Dro-L-X-H Pre-pro = pre-pro peptide of protein C with all/part replaced by the corresponding peptide of either protein S, factors VII, IX or X, or prothrombin; L = AAs 1-149, 150, 151 or 152 of light chain; X = 3-10 Lys/arg residues; and H = heavy chain. Cells transformed with expression vectors contey the modified DNA sequences produce the new proteins which can be used to regulate anticoagulant and fibrinolytic systems. See also W09112320 (AAQ13357).

                                                                                                                                                                                                                                                                                             This sequence, or a fragment of it, is used in the construction of DNA sequences encoding hybrid phospholipid-binding proteins (PBP) having the same biological activity as human protein C or human activated protein C. The hybrid sequence would comprise at least one lipocortin phopholipid binding domain (PBD), e.g. of PAP-I, joined to a gla-domainless protein C or activated protein C. See AAQ12680-81 for such examples. A lambda gill confer to obtain this cDNA. See also AAQ12678-81. (Updated on 25-MAR-2003 to correct PA field.)
                                                                                                                                                                                                                                                                      512
Recombinant prodn. of hybrid phospholipid-binding proteins - comprising lipocortin phospholipid-binding domain and vitamin=K-dependent protein.
                                                                                                                                                                                                                                                                      453 CTCCAGAAAGAATGAAGAGATGGAGCCAAAGCAAAAGAATACCCAGCTGTGGATGTGAC

                                                                                                                                                                                                                                                                         A cDNA clone (AAT32795) codes for human full-length protein C (AAW02600), a zymogen of a serine protease that plays an important role in blood clotting and in the generation of fibrinolytic activity in vivo. It was obtd. from a cDNA library produced from Hep G2 cells by screening with a genomic fragment contg. an exon corresponding to amino acids -42 to -19 of the prepro-peptide. A genomic clone (AAT32796) was also obtd. The cDNA can be used for large-scale produ. of protein C, or versions of protein C modified to improve cleavage brewnen the heavy and light chains of the circulating intermediate. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                New DNA encoding modified forms of opt. activated protein C - and related transformed cells for prodn. of recombinant protein C for use e.g. as an anti-thrombotic agent.

                                                                                                                In the construction of the full length protein C gene this sequence is joined to a genomic clone (following removal of the introns). The desired genomic:cDNA is then generated by looping out of unwanted sequences using oligomicleotide-directed deletion mutagenesis. The protein produced upon transformation of mammalian host cells, contg. the recombinant DNA, has substantially the same biological activity as natural protein C and is hence useful in the treatment of blood coagulation disorders. See also AAN81564. (Updated on 25-MAR-2003 to correct PA field.)
Protein C DNA coding sequence and expression vector for prodn. - used for treating blood coagulation disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    453 CTCCAGAAAGAATGAAGAGATGGAGCCAAAGCAAAAGAATACCCAGCTGTGGATGTGAC 512
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence is one of a large number of 5' ESTS derived from mRNAs encoding secreted proteins. An ORF has been identified within the sequence. The S' ESTS were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from olygo-dT primed cDNA libraries. Such ESTS are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human, 5' EST; expressed sequence tag; secreted protein; cDNA isolation; gene therapy; chromosome mapping; ss.

obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion

```

The nucleotide sequence of synthetic DNA encodes the amino acid sequence including the Gla domain of Factor-XI. See also AAN93063 and AAN93746-49. (Updated on 25-MAR-2003 to correct PF field.) (Updated on 25-MAR-2003 to correct PF field.)

Hybrid protein of protein C_with replaced Gla domain - using human vitamin=K dependent proteins, e.g. factor X, to give improved anticoagulation activity.

Table 5, Page 14; 23pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a novel isolated polynucleotide comprising a plant nucleotide sequence having an open reading frame that encodes a polypeptide associated with disease resistance or its fragment having substantially the same activity as the full-length polypeptide. The polynucleotide of the invention is useful for conferring resistance or tolerance to a plant pathogen. The present sequence represents a gene conferring disease resistance used in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              1654 CCTCTGTATCATGGAAAAAGCAAGAGTTCCAGAAAAACATCTATTTCTGCTTTATTGA

```

The invention relates to a purified nucleic acid molecule associated with lactation or muscle and fat deposition (designated IMPD), derived from cattle, and the IMPD nucleic acid can specifically hybridise to a second nucleic acid molecule comprising any of 15112 nuclectide sequences, appearing as ABX34836-ABX49947, or complements of them. Also included are if (1) a transformed cell having a nucleic acid comprising an IMPD nucleic acid linked to a promoter and a 3 non- translated sequence that functions in the cell to cause termination of transcription and addition of polyadenylated ribonucleotides to a 3 end of the mark and addition of polyadenylated ribonucleotides to a 3 end of the mark and addition of the 15112 nucleic acid molecule of an anchecule in a bovine cell or tissue comprising: (a) incubating a marker nucleic acid (comprising any of the 15112 nucleic acid molecule obtained from the bovine cell or tissue, where hybridisation between the marker nucleic acid and the complementary nucleic acid molecule obtained from the bovine cell or tissue. Complementary nucleic acid molecule obtained from the molecule, and (b) detecting the level or pattern of the complementary nucleic acid is used for the detection of the molecule. The LMPD molecule, and is used for determining a level or pattern of a molecule in a bovine cell or tissue. It is useful for genome mapping gene identification and analysis, cattle breather sequence mapping gene identification and analysis, cattle breather sequence and engagement the molecule of the present sequence is one of the present sequence and proved the province and analysis, and the propagation of any part of any province tag) nucleic acid acid and the present sequence and analysis and analysis and analysis and analysis and analysis and analysis and analysis and analysis and analysis and analysis and analysis and analysis and analysis and analysis and analysis and analysis and analysis and analysis and analysis and analysis and analysis and analysis and analysis and analysis and ovine LMFD EST (expressed sequence tag) nucleic acids. Note: The sequence was not shown in the specification but was obtained in electronic format from the USPTO web site: segdata.uspto.gov/sequence.html?DocID=20020137139 present

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention is concerned with a number of human single nucleotide polymorphisms (SNPs) which the inventors identified in human genes. These SNPs can be used in disease diagnosis and prediction of an individual's susceptibility to disease, in forensic and prediction of an and in genetic mapping. In particular, the SNPs of the invention can be used to diagnose useeptibility to diseases of the cardiovascular, endocrine and neurological systems, such as coronary artery disease, schizophrenia, cancer, autoimmune diseases, Alzheimer's and Parkinson's diseases. Note: The degenerate codon within the sequence represents the position of an SNP, for example the letter S represents a polymorphism where the nucleotide may be C or G
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

Efficient processing and release of mature two-chain factor X into the circulation requires: removal of the signal sequence; formation of circulation requires: removal of the signal sequence; formation of distinction of the signal sequence; formation of circulation dends; modification of one aspatic acid; modification of N = and O-linked oligosaccharides to the activation peptide; converse of an internal tripeptide to yield two-chain factor X and removal of the propeptide just prior to secretion. While some of these of the signal sequence, propeptide, internal tripeptide and full gamma-converse of biologically active factor X/Fxa. Isolated chimeric of the signal sequence, propeptide, internal tripeptide and full gamma-converse or biologically active factor X/Fxa. Isolated chimeric of production of biologically active factor X/Fxa. Isolated chimeric polymucleocides are described which encode a propeptide fused to a nucleic acid sequence encoding a vitamin X-dependent protein gamma-carboxylation enhancers and are useful for optimising the gamma-carboxylation of a WKDP to produce a fully gamma-carboxylation of a WKDP to produce a fully gamma-carboxylation of fully gamma-carboxylated manure WKDP. The clusion proteins and recombinant cells expressing them are useful in the production of fully gamma-carboxylated mature WKDP. The clusion proteins of fully gamma-carboxylated mature wKDP. The chologically active. The invention encompasses all combinations of the signal, propeptide and mature protein sequence encodes the signal, propeptide and mature protein sequence encodes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Vitamin K dependent protein, VXDP, gamma-carboxylation, chimeric protein, fusion protein; coagulation factor, Factor X; Factor VII; Protein S; Factor IX; Protein C; prothrombin; blood clotting; haemophilia; human;

The invention relates to nucleic acid sequences which regulate gene expression in an age-related manner and/or in a liver-specific manner. The invention identifies regions of the human factor IX (hFIX) gene, and a region of the human protein C (hPC) gene, which are age-related ca region of the human protein C (hPC) gene, which are age-related ceglatory sequences. The hFIX age-related regulatory sequences are region of the human protein C (hPC) gene, which are age-related in the 5, or the position 2164-2165 of AAF54018) and 3 'UR (at position 34383-00 or the lifespan of an individual; howers, they can independently exert effects on hFIX mRNA, in an age-related manner, with AES acting to stabilise hFIX mRNA, and AE3 acting to increase hFIX mRNA in an age-related manner, with AES acting to stabilise hFIX mRNA, and AE3 acting to increase hFIX mRNA, and or a serial activator of the contains two PEA-3 (polyoma virus activator 3) elements of the invention, along with their homologues, variants and fragments, may be used in the construction of recombinant expression vectors for the expression of desired sequence in an age-related fashion in a host call. Preferred target genes for expression in such age-regulated feature call. Preferred target genes for expression in such age-regulated feature call antitrypain, PEA-3 protein and reporter proteins such as luciferase.

Coagulants protein C and antithrombin III), human alpha-1-
coagulants protein C and antithrombin III), human alpha-1-
coagulants protein C and antithrombin III), human alpha-1-
coagulants protein C and antithrombin HEA speciatory correct or and the SP6 promoter. The expression vectors of the invention may be used in gene therapy to provide age-related and/or liver-specific expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Disclosure; Fig 12; 225pp; English.

of target genes. Age-regulatable constructs may be used in the treatment disease, diabetes. Alzelmer's disease, Parkinson's disease, cancer, osteoporosis, osteoarthritis and dementia. Specifically, they may be used to express factor IX antisense mRNA in the treatment of thrombotic conditions associated with the natural age-related rise in factor IX expression. Transgenic cells or animals that contain vectors of the invention are useful as models of these diseases, in screening for potential therapeutic agents and for studying normal processes such as ageing and gene expression. Fragments and homologues of age-related regulatory sequences, are useful as probes to detect, isolate or identify other such sequences in samples. The present sequence represents the hPC

Diagnosing and detecting the progression of liver cancer, hepatocellular carcinoma or metastatic liver tumor in a patient, involves detecting the level of expression of two or more genes in a liver tissue sample.

Claim 1; SEQ ID NO 3673; 298pp; English.

The invention relates to a novel method for diagnosing and detecting the progression of liver cancer, hepatocellular carcinoma or metastatic liver tumour in a patient, and differentiating metastatic liver cancer from hepatocellular carcinoma in a patient, involving detecting the level of expression of two or more genes represented in ABN93503-ABN97455 in a tissue sample. The method of the invention has hepatotropic, and cytostatic activity. The method is useful for diagnosing and detecting the progression of liver cancer, hepatocellular carcinoma and metastatic expression profiles which serve as useful diagnostic markers as well as markers that can be used to monitor disease states, disease progression, drug efficacy and drug metabolism. Note: The sequence data

27-MAR-2001; 2001WO-US009761.

This invention relates to novel isolated human proteins, which are human protein modification and maintenance molecules (PMMM). The cellular processes regulating modification and maintenance of protein molecules coordinate their function, conformation, stabilisation and degradation. Each of these processes is mediated by key enzymes or proteins such as kinases, phosphatases, proteases, protease inhibitors, isomerases,

Claim 5; SEQ ID NO 88; 405pp; English.

The present invention provides single-stranded oligonucleotides which can be used for the targeted alteration of genomic sequences, where the oligonucleotide has at least one mismatch compared with the genomic sequence to be altered. In particular, these sequences are directed at the following genes: adenosine deaminase, p53, beta-globin, retinoblastoma, BRCA1, BRCA2, CFTR, cyclin-dependent kinase inhibitor 2A (CDRU2A), ABC, Factor V, Factor VIII, Factor IX, haemoglobin alpha locus (CDRU2A), haemoglobin alpha locus 2 (HBA2), MLHI, MBH2, MBH6, apollipoprotein E (APOE), LDL receptor (LDLR), UDP-glucuronosyltransferase (UGTI), anyloid precursor protein (APC), presentilin-1 (PSENI) and presentilin-2 (PSENI). These can be used in the gene therapy of diseases such as cancer, adenosine deaminase deficiency, cystic fibrosis, haemophilia, hypercholesterolaemia, thalassaemia, sickle cell anaemia, arious syndromes. The present sequence is one of the gene correcting oligonucleotides of the invention
                                                                                                                                                                                                                                            Oligonucleotide for targeted alterations of genetic sequences and for treating cystic fibrosis, comprises at least one mismatch and chemical modification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 121 BP; 31 A; 29 C; 15 G; 46 T; 0 U; 0 Other;

RESULT 230
```

```
be used for the targeted alteration of genomic sequences, where the oligonucleotide has at least one mismatch compared with the genomic sequence to be altered. In particular, these sequences are directed at the following genes: adenosine deaminase, p53, beta-globin, retinoblastoma, BRCA1, BRCA2, CFTR, cyclin-dependent kinase inhibitor 2A (CDKNZA), APC, Factor V, Factor VII, Factor IX, haemoglobin alpha locus 1 (HBA1), haemoglobin alpha locus 2 (HBA2), MLH1, MH2, MSH2, MSH6, apolipoprotein E (APOB), LDL receptor (LDLR), UDP-glucuronosyltransferase (UGT1), amyloid precursor protein (APC), presentian-1 (FSEN1) and presentian-2 (FSEN2). These can be used in the gene therapy of diseases such as cancer, adenosine deaminase deficiency, cystic fibrosis, Alzheimer's disease, melanoma, adenomatous polyposis of the colon and various syndromes. The present sequence is one of the gene correcting
                                                                                                                                                                                                                                                                                                                                                               The present invention provides single-stranded oligonucleotides which can
                                                                                                                                                                                                                                       Oligonuclectide for targeted alterations of genetic sequences and for treating cystic fibrosis, comprises at least one mismatch and chemical modification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  838

```
The present invention provides single-stranded oligonucleotides which can be used for the targeted alteration of genomic sequences, where the oligonucleotide has at least one mismatch compared with the genomic sequence to be altered. In particular, these sequences are directed at the following genes: adenosine deaminase, p53, beta-globin, rectinoblascoma, BRCA1, BRCA2, CFTR, cyclin-dependent Kinase inhibitor 2A (CDKN2A), APC, Factor V, Factor VIII, Factor IX, haemoglobin alpha locus (CDKN2A), haemoglobin alpha locus 2 (HBA2), manyloid precursor protein (APC), presentin-1 (BSEN1) and presentilin-2 (PSEN1). These can be used in the gene therapy of diseases such as cancer, adenosine deaminase deficiency, cystic fibrosis, haemoghila, hypercholesterolaemia, thalasseamia, sickle cell anaemia, alzheimer's disease, melanoma, adenomatous polyposis of the colon and various syndromes. The present sequence is one of the gene correcting
                                                                                                                                                                                                                                                   Oligonucleotide for targeted alterations of genetic sequences and for treating cystic fibrosis, comprises at least one mismatch and chemical modification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 121 BP; 31 A; 29 C; 16 G; 45 T; 0 U; 0 Other;

```

The present invention provides single-stranded oligonucleotides which can be used for the targeted alteration of genomic sequences, where the coligonucleotide has at least one mismatch compared with the genomic sequence to be altered. In particular, these sequences are directed at the following genes: adenosine deaminase, p53, beta-globin, cationblastoma, BRCA1, BRCA2, CFTR, cyclin-dependent kinase inhibitor 2A (CDRNA), APC, Pactor VIII, Factor IX, haemoglobin alpha locus (CDRNA), APC, Pactor VIII, Factor IX, haemoglobin alpha locus (CDRNA), APC, pactor VIII, SayConton State (CDRNA), APC, presential cours (ADLN), UDL receptor (LDLN), UDP-glucuronosyltransferase (UGTI), anyloid precursor protein (ADC), presentian (PSENI) and presentian-2 (PSENI). These can be used in the gene therapy of diseases such as cancer, adenosine deaminase deficiency, cystic fibrosis, haemoghilia, hypercholeserolaemia, thalassaemia, sickle cell anaemia, Alzheimer's disease, melanoma, adenomatous polyposis of the colon and various syndromes. The present sequence is one of the gene correcting oligonucleotides of the invention

Oligonucleotide for targeted alterations of genetic sequences and for treating cystic fibrosis, comprises at least one mismatch and chemical modification.

Rice MC,

The present invention provides single-stranded oligonucleotides which can be used for the targeted alteration of genomic sequences, where the oligonucleotide has at least one mismatch compared with the genomic sequence to be altered. In particular, these sequences are directed at the following genes: adenosine deaminase, p53, beta-globin, cetinoblascoma, BRCAI, BRCAZ, CFTR, CYCLIN-dependent kinase inhibitor 2A (CDKNZA), APC, Factor V, Factor VIII, Factor IX, heemoglobin alpha locus (HBAI), haemoglobin alpha locus 2 (HBAI), haemoglobin alpha locus 2 (HBAI), amyloid precursor protein (APC), presentin-1 (PSENI) and presentin-2 (PSENI). The gene therapy of diseases such as cancer, adenosine deaminase deficiency, cystic fibrosis, chaemophila, hypercholesterolaemia, thalassaemia, sickle cell anaemia, Alzheimer's disease, melanoma, adenomatous polyposis of the colon and conventing and colon and conventing and colon and conventing and colon and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and col

Homo sapiens,

The present invention provides single-stranded oligonucleotides which can be used for the targeted alteration of genomic sequences, where the oligonucleotide has at least one mismatch compared with the genomic sequence to be altered. In particular, these sequences are directed at the following genes: adenosine deaminase, p53, beta-globin.

The following genes: adenosine deaminase, p53, beta-globin.

The following genes: adenosine deaminase, p53, beta-globin.

The following genes: adenosine deaminase, p53, beta-globin.

The following genes: adenosine deaminase deficiency. The middle and alpha locus approprient E (APCB), LDL receptor (LDLR), MDF-glucuronesyltransferase (UGTI), amyloid precursor protein (APC), presentlin-1 (PSENI) and presentlin-2 (PSENI). These can be used in the gene therapy of diseases such as cancer, adenosine deaminase deficiency, cystic fibrosis, hemophilia, hypercholesteroleemia, thalassaemia, sickle cell anaemia, Alzheimer's disease, melanoma, adenomatous polyposis of the colon and correcting and an anaemia, and also seems the colon and all and an anaemia, and also seems the colon and all and an anaemia, and a cancer of the colon and all and an anaemia and an anaemia, and a seems and a seems and a seem to seem the colon and a seem and a seems and a seem to seem the sequence is one of the gene correcting and an anaemia. Oligonucleotide for targeted alterations of genetic sequences and for treating cystic fibrosis, comprises at least one mismatch and chemical Claim 7; Page 182; 294pp; English. oligonucleotides of the invention 27-MAR-2000; 2000US-0192176P. 27-MAR-2000; 2000US-0192179P. 01-JUN-2000; 2000US-0208538P. 30-OCT-2000; 2000US-0244989P. 27-MAR-2001; 2001WO-US009761 Gamper HB, (UYDE ) UNIV DELAWARE WPI; 2001-639230/73. ```
The present invention provides single-stranded oligonucleotides which can be used for the targeted alteration of genomic sequences, where the oligonucleotide has at least one mismatch compared with the genomic sequence to be altered. In particular, these sequences are directed at the following genes: adenosine deaminase, p53, beta-globin, cetinoblascoma, BRCA1, BRCA2, CFTR, cyclin-dependent kinase inhibitor 2A (CDKNZA), APC, Factor V, Factor VIII, Factor IX, haemoglobin alpha locus (HBA1), haemoglobin alpha locus 2 (HBA2), MLH1, MSH2, MSH6, apolicipoprotein (APC), Leceptor (LDLR), UDP-glucuronosyltransferase (UGT1), amyloid precursor protein (APC), presentlin-1 (PSENI) and presentlin-2 (PSENI). These can be used in the gene therapy of diseases such as cancer, adenosine deaminase deficiency, cystic fibrosis, haemophilia, hypercholesterolaemia; thalassaemia, sickle cell anaemia, Alzheimer's disease, melanoma, adenomatous polyposis of the colon and variants syndromes. The present sequence is one of the gene correcting

```
The present invention provides single-stranded oligonucleotides which can be used for the targeted alteration of genomic sequences, where the oligonucleotide has at least one mismatch compared with the genomic equence to be altered. In particular, these sequences are directed at the following genes: adenosine deaminase, p53, beta-globin, rectantibulascoma, BRCAH, BRCAL, CFTR, CYCLIN-dependent kinase inhibitor 2A (CDKNZA), APC, Ractor V, Factor VIII, Factor IX, haemoglobin alpha locus 2 (HBA1), haemoglobin alpha locus 2 (HBA2), MLH1, MSH2, MSH6, applicable in E (APC), L receptor (LDLR), UDF-glucuronesyltransferase (UGT1), amyloid precursor protein (APC), presentin-1 (PSENI) and presentin-2 (PSENI). These can be used in the gene therapy of diseases such as cancer, adenosine deaminase deficiency, cystic fibrosis, hemophilia, hypercholesterolaemia, thalassaemia, sickle cell anaemia, althermer's disease, melanoma, adenomatous polyposis of the colon and control of the present sequence is one of the gene correcting
                                                                                                                                                                                                                                                                                                                                                                                                          Oligonucleotide for targeted alterations of genetic sequences and for treating cystic fibrosis, comprises at least one mismatch and chemical modification.

```
be used for the targeted alteration of genomic sequences, where the oligonuclectide has at least one mismatch compared with the genomic sequence to be alterated. In particular, these sequences are directed at the following genes: adenosine deaminase, p53, beta-globin, cetinoblastoma, BRCA1, BRCA2, CFTR, cyclin-dependent kinase inhibitor 2h (CDRAN2), APC, Factor V, Factor VIII, Factor IX, haemoglobin alpha locus (CDRAN2), APC, Factor VIII, Factor IX, haemoglobin alpha locus (CDRAN1), and locus (CDRAN2), APC, Factor VIII, Factor IX, haemoglobin alpha locus (CUGTI), anyloid precursor protein (LDRA), WLH1, WSH2, WSH6, apolipoprotein B (APOE), LDL receptor (LDRA), UDP-glucuronosyltransferase (UGTI), anyloid precursor protein (APC), presentin-1 (PSEN1) and presentin-2 (PSEN2). These can be used in the gene therapy of diseases such as cancer, adenosine deaminase deficiency, cystic fibrosis, haemophila, hypercholesterolaemia, thalassaemia, sickle cell anaemia, various syndromes. The present sequence is one of the gene correcting cligonucleotides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention provides single-stranded oligonucleotides which can
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; gene therapy; adenosine deaminase deficiency; p53; beta-globin; retinoblastoma; BRCA1; BRCA2, CFTR; cystic fibrosis; cancer; Factor V; cyclin-dependent kinase inhibitor 2A; CDKV2A; melanoma; APC; HaBA1; HBA2, adenomatous polyposis of the colon; Factor VI; Factor IX; thrombosis; haemophilia; alpha thalassaemia; haemoglobin alpha locus 1; MLH1; APOB; mismatoh repair; MSH2; MSH6; hyperlipidaemia; apolipoprotein B; fulls; familial hypercholesterolaemia; UGT1; syndrome; APP; PSEN1; antisense; UDP-glucuronosyltransferase; amyloid precursor protein; presentiin-1;
                                                                                                                                                                                                                                                                                                                                                                                                                Oligonuclectide for targeted alterations of genetic sequences and for treating cystic fibrosis, comprises at least one mismatch and chemical modification.

The present invention provides single-stranded oligomucleotides which can be used for the targeted alteration of genomic sequences, where the oligomucleotide has at least one mismatch compared with the genomic sequence to be altered. In particular, these sequences are directed at the following genes: adenosine deaminase, p53, bera-globin, cetinobastoma, BRCAL, BRCAS, CFTR, cyclin-dependent kinase inhibitor 2A (CDXIZA), APC, Factor VII, Factor IX, haemoglobin alpha locus (HBA1), haemoglobin alpha locus (HBA2), MLH1, MSH2, MSH6, apolipoprotein E (APC), Leceptor (LDLR), UDP-glucuronosyltransferase (UCT1), amyloid precursor protein (APC), presentiln-1 (PSEN1) and presentiln-2 (PSEN2). These can be used in the gene therapy of diseases such as cancer, adenosine deaminase deficiency, cystic fibrosis, such as cancer, adenosine deaminase deficiency, cystic fibrosis, altabamer's disease, melanoma, adenomacous polyposis of the colon and colonial and altabamer's disease, melanoma, adenomacous polyposis of the colon and coling and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial and colonial an

                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                            The present invention is concerned with a number of human single nucleotide polymorphisms (SNPs) which the inventors identified in human genes. These SNPs can be used in disease diagnosis and prediction of an individual's susceptibility to disease, in forensic and paternity testing and in genetic mapping. In particular, the SNPs of the invention can be used to diagnose susceptibility to diseases of the cardiovascular, endocrine and neurological systems, such as coronary artery disease, schizophrenia, cancer, autoimmune diseases, Alzheimer's and Parkinson's diseases. Note: The degenerate codon within the sequence represents the position of an SNP, for example the letter S represents a polymorphism where the nucleotide may be C or G
                                                                                                                                                       Nucleic acid selected from one of 106 genes comprising single nucleotide polymorphisms, allele-specific oligonucleotides to the genes are useful for phenotypic correlations, forensics, paternity testing, medicine and

AAH57161 to AAH57576 represent cell and tissue specific polynucleotide sequences (I). (I) can have cytostatic, immunomodulatory and neuroprotective activities, and can be used in gene therapy. (I) and proteins (II) encoded by then are used in high throughput screening assays to select DNA molecules, RNA molecules, peptide nucleic acids, mimetics, peptides, proteins, agonists, antagonists, antibodies or their
                                                                                                                                              New polynucleotide comprising a plant nucleotide sequence having an open reading frame that encodes a polypeptide associated with disease resistance, useful for conferring resistance or tolerance to a plant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; tissue specific; diagnosis; brain; heart; skeletal muscle; lung;

                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a novel isolated polynucleotide comprising a plant nucleotide sequence having an open reading frame that encodes a polypeptide associated with disease resistance or its fragment having substantially the same activity as the full-length polypeptide. The polynucleotide of the invention is useful for conferring resistance or telerance to a plant pathogen. The present sequence represents a gene conferring disease resistance used in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          gene therapy; cancer; immunopathology; neuropathology
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            18

                agents. Expression of (I) in a sample indicates the differentation of embryonic stem cells into a tissue selected from brain, heart, kidney, liver, lung, skeletal muscle or pancreatic tissues. (I) and (II) are used to produce an expression profile that defines a metabolic or developmental process, treatment, condition, disease or disorder. The gene profile can be used for diagnosis, prognosis or monitoring of treatments and for investigating a predisposition to a disorder where the gene is associated with a cancer, immunopathology or neuropathology
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence describes a purified corn tassel-derived polynucleotide sequence (cdps) comprising a nucleic acid sequence selected from those given in ABL70627 to ABL76831. The cdps sequences encode corn tassel-derived polypeptides (CDPs). The cdps sequences (I) regulatory elements and to follow inheritance of desirable characteristics through hybrid annews. (I) are also useful in the evaluation, and alteration of desired characteristics associated with growth and development, disease resistance, environmental adaptability, quality and yield, and as molecular markers for studying inheritance of multigene traits in a plant breeding program. (I) can be used to produce a tassel-specific profile of gene transcription, a transcript image, to

Troglitazone is a hepatotoxic compound. The sequence was identified using the method of the invention. The sequence was identified using the method of the invention. The septence was identified using the method of the invention. The specification describes a method for screening a test agent for hepatotoxicity, the method comprises using a test cell population which comprises a cell capable of expressing one or more mucleic acid sequences selected from HEPATOX 1-169. Of these, HEPATOX 1-21 are novel sequences. HEPATOX proteins are useful as immunogens to raise anti-HEPATOX antibodies. (Updated on 06-AUG-2003 to correct OS
clone regulatory elements for use in transformation vectors, to express polypeptide, to identify, isolate or extend identical or related corn tassel nucleic acid sequences from DNA libraries, in nucleic acid hybridisation or amplification technologies, as query sequences to determine homology of known sequences, as probe for use in Southern or Northern hybridisation, and to identify the presence of and/or to determine the degree of similarity between two (or more) nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Screening a test agent for hepatotoxicity by contacting with cells expressing HEPATOX nucleic acid sequences, measuring expression of the nucleic acids and comparing with a control.

```
The present sequence represents a human expressed sequence tag (EST). The polynucleotide, which is a secreted BST, and the encoded protein are predicted to have useful biological activities which would make them suitable for treating, preventing or ameliorating medical conditions in humans and animals, although no supporting data is given. Suggested scrivities include nucritional activity, immune stimulating or suppressing activity, heamatopoiesis regulating activity, issue growth activity, activity, chemotociclohemokinetic activity, and heamatopy activity, chemotociclohemokinetic activity, inflammatory activity, cadherin/twour invasion suppressor activity, inclument invasion suppressor activity.
                                                                                                                                                                                                                                                                                                                                   Human, secreted protein, expressed sequence tag; EST; haematopoiesis; tissue growth; activin; inhibin; chemotaxis; chemokinesis; haemostatic; receptor; ligand; thrombolytic; anti-inflammatory; cadherin; anti-tumour;

The invention relates to purified human transmembrane serine protease (TSP) polypeptide, comprising a protease domain of a type-II membrane-type serine protease or its biologically active portion. The invention is useful for cleaving a TSP substrate protein by contacting TSP with a substrate protein under serine protease activity permissive conditions. The invention is useful as an immunogen to generate antibodies that bind TSP or TSP1-TSP43 proteins, useful for treating disease e.g. cancer and autoimmune disease. The present sequence is human TSP1-TSP34 gene exon
                                                                                                                                                                                                                                                                                                                                                                                                                                                New purified transmembrane serine protease polypeptides (TSP1-TSP34) comprising a protease domain or its biologically active portion, useful for identifying modulators of proteolysis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

The invention relates to novel serine proteases designated BSSP2

(AAB11695-B11699), and to nucleic acids encoding them (AAA61659-A61663).

The invention also relates to vectors and transformants comprising BSSP2

nucleic acids; transgenic animals in which the expression level of BSSP2

can be varied; and an mBSSP2 knockout mouse. The invention additionally

encompasses anti-BSSP2 antibodies and methods of production of such

encompasses anti-BSSP2 antibodies and methods of production of such

encompasses anti-BSSP2 antibodies. And the use
of BSSP2 proteins or fragments as diagnostic markers for certain medical

conditions. Nucleotides encoding BSSP2 were initially isolated in a mouse

brain cDNA library using degenerate PCR primers (AAA61674)

based on conserved regions of serine proteases. The BSSP2 serine

proteases and nucleotides encoding them are useful in detecting

proteases and nucleotides encoding them are useful in detecting

conditions such as Alzheimer's disease, epilepsy, cancer, inflammation,

blood, urine, brain, prostate gland and testis) as diagnostic markers for

conditions such as Alzheimer's disease, epilepsy, cancer, inflammation,

infertility and prostatic hypertrophy. Sequences AAA61659-A61662

represent cDNAs encoding nurine BSSP2 (ABSSP2), and sequence

AAA61663 represents cDNA encoding human BSSP2 (HBSSP2)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human, Protein C, precursor protein; ds; gene; N-glycosylation; serum half-life; Chromosome GQ13-qd; stroke; myocardial infarction; after venous thrombosis, disseminated intravascular coagulation; DIC; sepsis; septic shock; embolism; pulmonary embolism; burn, pregnancy; bone marrow transplantation; major surgery; trauma; ARDS; coagulant; adult respiratory distress syndrome; alpha-l antitrypsin; APC; activated protein C.

The invention relates to a conjugate (I) comprising at least one non-
polypeptide moiety (II) (e.g. an N-glycosyl group) covalently attached to
a procein C polypeptide comprising an amino acid sequence which differs
created protein C polypeptide (III) in at least one
introduced and/or at least one removed amino acid residue comprising an
attachment group for the non-polypeptide group (e.g. an N-glycosylation
created and/or at least one removed amino acid residue comprising an
attachment group for the non-polypeptide group (e.g. an N-glycosylation
comprising of the position (P) where (P) is an amino acid with at least
created and/or at least one temoved amino acid with at least
created and/or at least one temoved amino acid with at least
created and/or hardyfale/His/Lys/Arg/Asn/Asp/Glu/Gly/Gln (III)
comprising (N) or (VI); (3) an expression vector (VI); (3) an expression vector (VI); (3) an expression vector (VI); (3) an expression vector (VI); (3) an expression vector (VI); (3) an expression vector (VI); (4) a not ending
(IV); (3) an expression vector (VI); (3) an endicate for the treatment (and
conjugates, variants and protein (C proteins are useful as medicaments,
and in the manufacture of medicaments for the treatment (and
conjugates, variants and protein C proteins are useful as medicaments,
and in the manufacture of medicaments for the treatment (and
conjugates, variants pregnancy emboli, transplantation and alpha-1
crespiratory distress syndrome (ARBS). The variant protein C has an
antitrypsin. The conjugates have an increased and plasma and alpha-1
creased sectum half-life, increased resistant to inhibitors, reduced
antitrypsin. The conjugates have an increased bloavailability.
The conjugate offers a number of advantages over the currently available.
ARC products, including longer duration between injections,
conforted anticoagulant activity is beneficial to reduce the risk of
cleativated protein C) conjugates. This must be especially important when
the conjugate base an extended plasma the endiant secto
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel conjugate useful for treating or preventing septic shock, stroke and myocardial infarction, comprises non-polypeptide group covalently attached to protein C polypeptide comprising an attachment group.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           located on chromosome 2q13-q14. The present sequence encodes precursor

It is used as an anti-coagulant in myocardial infarction and deep vein thrombonis. The patent discloses a recombinant way of making activated protein C.

Nucleorides 1-125 encode the signal peptide and propeptide; 126-589
592 residues are believed to be removed to form 2-chain protein C; 598-631 are the activation peptides removed from the zymogen to form c; 598-631 are the activation peptides removed from the zymogen to form activated protein C; 634-1380 constitute the activated heavy chain after post-translational modification. (Updated on 25-MAR-2003 to correct PD field.)                                                                                                                                                                                                                                                          Sequence 3, Application US/07882202A;
Sequence 3, Application US/07882202A;
Patent No. 5374617;
GENERAL INFORMATION:
TILLE OF INVENTION: Treatment of Bleeding with Modified
TITLE OF INVENTION: Tissue Factor in Combination with FVIIa
NUMBER OF SEQUENCES:
ADDRESSEE: Richards, Medlock & Andrews
STREET: 1201 Elm Street, Suite 4500
CITY: Dallas
STATE: Texas
COUNTRY: US
STATE: Floppy disk
COMPUTER: BADABLE FORM:
MEDIUM TYPE: Floppy disk
COMPUTER: IBM C compatible
OPERATING SYSTEM: PC Compatible
OPERATING SYSTEM: PC DOS/MS.
SOFTWARE: PatentIn Release #1.0, Version #1.25
CLASSIPTATION NUMBER: US/07/882,202A
FILING DATE: 13-MAY-1992
CLASSIPTATION NUMBER: NEADMATE.

US-09-009-656-13

Sequence 13, Application US/09009656

Patent No. 6132730

GENERAL INFORMATION:
APPLICANT: Thorpe, Philip E.
APPLICANT: King, Steven W.
APPLICANT: King, Steven W.
APPLICANT: Gao, Boning
TITLE OF INVENTION: COMBINED TISSUE FACTOR AND FACTOR VIIa
TITLE OF INVENTION: METHODS AND COMPOSITIONS FOR COAGULATION AND TUMOR
TITLE OF INVENTION: TREATMENT
NUMBER OF SEQUENCES:
CORRESPONDENCE ADDRESS:
ADDRESSEE: Arnold, White & Durkee
STREET: P.O. Box 4433
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ch 0.5%; Score 18.4; DB 1; Length 1440; al Similarity 56.7%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        US-07-882-202A-3/C
US-07-882-202A-3/C
Sequence 3, Application US/07882202A
Patent No. 5374617
GENERAL INFORMATION:
APPLICANT: Comp., Philip C.
TITLE OF INVENTION: Treatment of Bleeding with Modified
TITLE OF INVENTION: Tissue Factor in Combination with FVIIa
NUMBER OF SEQUENCES: 4
CORRESPONDENCE ADDRESS:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        COUNTRY: Dallas

REFERE
TYPE: NUCLEIC ACID
STRANDEDNESS: double
TOPOLOGY: linear
MOLECULE TYPE: cDNA
HYPOTHETICAL: NO
ANTI-SENSE: NO
ORIGINAL SOURCE:
ORGANISM: Homo sapiens
TISSUE TYPE: Blood
FEATURE:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                LENGTH: 1440 base pairs
TYPE: nucleic acid
STRANDEDNESS: double
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ANTI-SENSE: NO
